

PRODUCT INFORMATION

CD56 Target

Synonyms NCAM1;CD56;MSK39;NCAM

Recombinant human CD56 protein with C-Description

terminal human Fc tag

Delivery In Stock **Uniprot ID** P13591 **Expression Host HEK293**

Tag C-Human Fc Tag

Molecular Characterization

Molecular Weight

Storage & Shipping

Background

Usage

Purity

CD56(Leu20-Gly708) hFc(Glu99-Ala330)

The protein has a predicted molecular mass of

102.3 kDa after removal of the signal peptide. The

apparent molecular mass of CD56-hFc is approximately 130-250 kDa due to glycosylation.

The purity of the protein is greater than 90% as determined by SDS-PAGE and Coomassie blue

staining.

Lyophilized from sterile PBS, pH 7.4. Normally 5 % Formulation & Reconstitution

- 8% trehalose is added as protectants before lyophilization. Please see Certificate of Analysis for specific instructions of reconstitution.

Store at -20°C to -80°C for 12 months in lyophilized form. After reconstitution, if not intended for use within a month, aliquot and store

at -80°C (Avoid repeated freezing and thawing). Lyophilized proteins are shipped at ambient

temperature.

This gene encodes a cell adhesion protein which is a member of the immunoglobulin superfamily. The encoded protein is involved in cell-to-cell interactions as well as cell-matrix interactions during development and differentiation. The encoded protein plays a role in the development

of the nervous system by regulating neurogenesis, neurite outgrowth, and cell migration. This protein is also involved in the expansion of T lymphocytes, B lymphocytes and natural killer (NK) cells which play an important role in immune surveillance. This protein plays a role in signal transduction by interacting with fibroblast growth factor receptors, N-cadherin and other components of the extracellular matrix and by triggering signalling cascades involving FYN-focal adhesion kinase (FAK), mitogen-activated

protein kinase (MAPK), and phosphatidylinositol 3-kinase (PI3K). One prominent isoform of this gene, cell surface molecule CD56, plays a role in several myeloproliferative disorders such as acute myeloid leukemia and differential expression of this gene is associated with differential disease progression. For example, increased expression of CD56 is correlated with lower survival in acute myeloid leukemia patients whereas increased severity of COVID-19 is correlated with decreased abundance of CD56-expressing NK cells in

peripheral blood. Alternative splicing results in multiple transcript variants encoding distinct

protein isoforms.

Research use only

Conjugate Unconjugated
